ABSTRACT:

PROBLEM TO BE SOLVED: To enable an operator of a machine for registration to perform data registering operation even during the service of a server for service as to the data registration system which registers data to the server for service from the machine for registration.

SOLUTION: In addition to the machine 1 for registration and server 3 for service, a server 5 for temporary registration that no user accesses is provided. In the service hours of the server 3 for service, the operator registers data to the server 5 for temporary registration from the machine 1 for registration and confirms whether the data are correctly registered by using a check terminal 7. Once it is confirmed that the data are correctly registered, information needed to register the same data to the server 3 for service in the same format is recorded in a registration information file 6 on the machine 1 for registration. After the service hours of the server 3 for service, the machine for registration 1 automatically registers the same data to respective servers for service according to the information recorded in the registration information file 6.
